

# CS 516: COMPILERS

## Lecture 13

### *Topics*

- First Class Functions: Lambda Calculus, Substitution, Evaluation
- Implementing an Interpreter

### *Materials*

- lec14.zip

# Announcements

- HW6: Frontend Compilation (OAT v. 1.0)
  - Parsing & basic code generation
  - **Due Thursday March 31 at 11:59**
  - **Oat v1 Definitions PDF**
- **Next Quiz topic:**
  - Parsing (In class, March 29th)
  - One-page, letter-sized, double-sided “cheat sheet” of notes permitted (must hand it in)

# Wrapping up Parsing

- Lec12: Parsing (finding derivations in a grammar)
  - LR Grammars
  - Shift/Reduce parsing
  - LR(0) Grammars
  - Menhir

# OAT and Homework 6

- Simple C-like Imperative Language
  - supports 64-bit integers, arrays, strings
  - top-level, mutually recursive procedures
  - scoped local, imperative variables
- See examples in hw4programs directory
- Homework 6 tasks:
  - Improve the parser to support all of hw5programs/\*
  - Compile Oat AST to LLVM:

```
let rec cmp_exp (c:Ctxt.t) (exp:Ast.exp node)  
  : Ll.ty * Ll.operand * stream =
```

```
let rec cmp_stmt (c:Ctxt.t) (rt:Ll.ty) (stmt:Ast.stmt node)  
  : Ctxt.t * stream =
```

```
...
```

# OAT and Homework 6

- To compile OAT variables, we maintain a mapping of source identifiers to the corresponding LLVMlite operands.
- Bindings are added for:
  - global OAT variables
  - local variables that are in scope.

```
module Ctxt = struct  
    type t = (Ast.id * (Ll.ty * Ll.operand)) list  
    . . .
```

Untyped lambda calculus  
Substitution  
Evaluation

# FIRST-CLASS FUNCTIONS

# “Functional” languages

- Languages like ML, Haskell, Scheme, Python, C#, Java 8, Swift
- Functions can be passed as arguments (e.g. map or fold)
- Functions can be returned as values (e.g. compose)
- Functions nest: inner function can refer to variables bound in the outer function

```
let add = fun x -> fun y -> x + y
let inc = add 1
let dec = add -1
```

```
let compose = fun f -> fun g -> fun x -> f (g x)
let id = compose inc dec
```

- How do we implement such functions?
  - in an interpreter? in a compiled language?

# (Untyped) Lambda Calculus

- The lambda calculus is a minimal programming language.
  - Note: we're writing `(fun x -> e)` lambda-calculus notation:  $\lambda x. e$
- It has variables, functions, and function application.
  - That's it!
  - It's Turing Complete.
  - It's the foundation for a *lot* of research in programming languages.
  - Basis for “functional” languages like Scheme, ML, Haskell, etc.

Abstract syntax in OCaml:

```
type exp =  
  | Var of var          (* variables *)  
  | Fun of var * exp    (* functions: fun x -> e *)  
  | App of exp * exp    (* function application *)
```

Concrete syntax:

```
exp ::=  
  | x                variables  
  | fun x -> exp     functions  
  | exp1 exp2      function application  
  | ( exp )          parentheses
```

# Values and Substitution

- The only values of the lambda calculus are (closed) functions:

```
val ::=  
    | fun x -> exp    functions are values
```

- To *substitute* a (closed) value  $v$  for some variable  $x$  in an expression  $e$ 
  - Replace all *free occurrences* of  $x$  in  $e$  by  $v$ .
  - In OCaml: written `subst v x e`
  - In Math: written  $e\{v/x\}$

- Function application is interpreted by *substitution*:

```
(fun x -> fun y -> x + y) 1  
= subst 1 x (fun y -> x + y)  
= (fun y -> 1 + y)
```

# Lambda Calculus Operational Semantics

- Substitution function (in Math):

$x\{v/x\}$	$= v$	<i>(replace the free <math>x</math> by <math>v</math>)</i>
$y\{v/x\}$	$= y$	<i>(assuming <math>y \neq x</math>)</i>
$(\text{fun } x \rightarrow \text{exp})\{v/x\}$	$= (\text{fun } x \rightarrow \text{exp})$	<i>(<math>x</math> is bound in <math>\text{exp}</math>)</i>
$(\text{fun } y \rightarrow \text{exp})\{v/x\}$	$= (\text{fun } y \rightarrow \text{exp}\{v/x\})$	<i>(assuming <math>y \neq x</math>)</i>
$(e_1 \ e_2)\{v/x\}$	$= (e_1\{v/x\} \ e_2\{v/x\})$	<i>(substitute everywhere)</i>

- Examples:

$x \ y \ \{(\text{fun } z \rightarrow z)/y\}$

$\Rightarrow$  Answer...

$(\text{fun } x \rightarrow x \ y)\{(\text{fun } z \rightarrow z) / y\}$

$\Rightarrow$  Answer...

$(\text{fun } x \rightarrow x)\{(\text{fun } z \rightarrow z) / x\}$

$\Rightarrow$  Answer...

# Lambda Calculus Operational Semantics

- Substitution function (in Math):

$x\{v/x\}$	$= v$	<i>(replace the free <math>x</math> by <math>v</math>)</i>
$y\{v/x\}$	$= y$	<i>(assuming <math>y \neq x</math>)</i>
$(\text{fun } x \rightarrow \text{exp})\{v/x\}$	$= (\text{fun } x \rightarrow \text{exp})$	<i>(<math>x</math> is bound in <math>\text{exp}</math>)</i>
$(\text{fun } y \rightarrow \text{exp})\{v/x\}$	$= (\text{fun } y \rightarrow \text{exp}\{v/x\})$	<i>(assuming <math>y \neq x</math>)</i>
$(e_1 \ e_2)\{v/x\}$	$= (e_1\{v/x\} \ e_2\{v/x\})$	<i>(substitute everywhere)</i>

- Examples:

$$x \ y \ \{(\text{fun } z \rightarrow z)/y\} \quad \Rightarrow \quad x \ (\text{fun } z \rightarrow z)$$

$$(\text{fun } x \rightarrow x \ y)\{(\text{fun } z \rightarrow z) / y\} \Rightarrow \text{Answer...}$$

$$(\text{fun } x \rightarrow x)\{(\text{fun } z \rightarrow z) / x\} \Rightarrow \text{Answer...}$$

# Lambda Calculus Operational Semantics

- Substitution function (in Math):

$x\{v/x\}$	$= v$	<i>(replace the free <math>x</math> by <math>v</math>)</i>
$y\{v/x\}$	$= y$	<i>(assuming <math>y \neq x</math>)</i>
$(\text{fun } x \rightarrow \text{exp})\{v/x\}$	$= (\text{fun } x \rightarrow \text{exp})$	<i>(<math>x</math> is bound in <math>\text{exp}</math>)</i>
$(\text{fun } y \rightarrow \text{exp})\{v/x\}$	$= (\text{fun } y \rightarrow \text{exp}\{v/x\})$	<i>(assuming <math>y \neq x</math>)</i>
$(e_1 \ e_2)\{v/x\}$	$= (e_1\{v/x\} \ e_2\{v/x\})$	<i>(substitute everywhere)</i>

- Examples:

$$x \ y \ \{(\text{fun } z \rightarrow z)/y\} \quad \Rightarrow \quad x \ (\text{fun } z \rightarrow z)$$

$$(\text{fun } x \rightarrow x \ y)\{(\text{fun } z \rightarrow z) / y\} \Rightarrow (\text{fun } x \rightarrow x \ (\text{fun } z \rightarrow z))$$

$$(\text{fun } x \rightarrow x)\{(\text{fun } z \rightarrow z) / x\} \Rightarrow \boxed{\text{Answer...}}$$

# Lambda Calculus Operational Semantics

- Substitution function (in Math):

$x\{v/x\}$	$= v$	<i>(replace the free <math>x</math> by <math>v</math>)</i>
$y\{v/x\}$	$= y$	<i>(assuming <math>y \neq x</math>)</i>
$(\text{fun } x \rightarrow \text{exp})\{v/x\}$	$= (\text{fun } x \rightarrow \text{exp})$	<i>(<math>x</math> is bound in <math>\text{exp}</math>)</i>
$(\text{fun } y \rightarrow \text{exp})\{v/x\}$	$= (\text{fun } y \rightarrow \text{exp}\{v/x\})$	<i>(assuming <math>y \neq x</math>)</i>
$(e_1 \ e_2)\{v/x\}$	$= (e_1\{v/x\} \ e_2\{v/x\})$	<i>(substitute everywhere)</i>

- Examples:

$$x \ y \ \{(\text{fun } z \rightarrow z)/y\} \quad \Rightarrow \quad x \ (\text{fun } z \rightarrow z)$$

$$(\text{fun } x \rightarrow x \ y)\{(\text{fun } z \rightarrow z) / y\} \Rightarrow (\text{fun } x \rightarrow x \ (\text{fun } z \rightarrow z))$$

$$(\text{fun } x \rightarrow x)\{(\text{fun } z \rightarrow z) / x\} \Rightarrow (\text{fun } x \rightarrow x) \quad // \ x \text{ is not free!}$$

# Free Variables and Scoping

```
let add = fun x -> fun y -> x + y
let inc = add 1
```

- The result of `add 1` is a function
- After calling `add`, we can't throw away its argument (or its local variables) because those are needed in the function returned by `add`.
- We say that the variable `x` is *free* in `fun y -> x + y`
  - Free variables are defined in an outer scope
- We say that the variable `y` is *bound* by “`fun y`” and its scope is the body “`x + y`” in the expression `fun y -> x + y`
- A term with no free variables is called *closed*.
- A term with one or more free variables is called *open*.

# Free Variable Calculation

- An OCaml function to calculate the set of free variables in a lambda expression:

```
let rec free_vars (e:exp) : VarSet.t =  
  begin match e with  
    | Var x          -> VarSet.singleton x  
    | Fun(x, body)   -> VarSet.remove x (free_vars body)  
    | App(e1, e2)    -> VarSet.union (free_vars e1) (free_vars e2)  
  end
```

- A lambda expression  $e$  is *closed* if `free_vars e` returns `VarSet.empty`
- In mathematical notation:

$$\begin{aligned} \text{fv}(x) &= \{x\} \\ \text{fv}(\text{fun } x \rightarrow \text{exp}) &= \text{fv}(\text{exp}) \setminus \{x\} \quad (\text{'x' is a bound in exp}) \\ \text{fv}(\text{exp}_1 \text{ exp}_2) &= \text{fv}(\text{exp}_1) \cup \text{fv}(\text{exp}_2) \end{aligned}$$

# Variable Capture

- Note that if we try to naively "substitute" an open term, a bound variable might capture the free variables:

$$\begin{aligned} & (\text{fun } x \rightarrow (x \ y)) \ \{(\text{fun } z \rightarrow x) / y\} \\ = & \text{fun } x \rightarrow (x \ (\text{fun } z \rightarrow x)) \end{aligned}$$

Note:  $x$  is free in  $(\text{fun } x \rightarrow x)$   
free  $x$  is *captured!!*

- Usually *not* the desired behavior
  - This property is sometimes called "dynamic scoping"  
The meaning of " $x$ " is determined by where it is bound dynamically, not where it is bound statically.
  - Some languages (e.g. emacs lisp) are implemented with this as a "feature"
  - But, leads to hard to debug scoping issues

# Alpha Equivalence

- Note that the names of bound variables don't matter.
  - i.e. it doesn't matter which variable names you use, as long as you use them consistently

(fun **x** -> y **x**) is the "same" as (fun **z** -> y **z**)

the choice of "x" or "z" is arbitrary, as long as we consistently rename them

Two terms that differ only by consistent renaming of bound variables are called *alpha equivalent*

- The names of free variables do matter:

(fun x -> **y** x) is *not* the "same" as (fun x -> **z** x)

Intuitively: y and z can refer to different things from some outer scope

# Fixing Substitution

- Consider the substitution operation:

$$\{e_2/x\} e_1$$

- To avoid capture, define substitution to pick an alpha equivalent version of  $e_1$  such that the bound names of  $e_1$  don't mention the free names of  $e_2$ .
  - Then do the “naïve” substitution.

For example:  $(\text{fun } x \rightarrow (x \ y)) \{(\text{fun } z \rightarrow x) / y\}$   
=  $(\text{fun } x' \rightarrow (x' \ y)) \{(\text{fun } z \rightarrow x) / y\}$     *rename x to x'*  
=  $(\text{fun } x' \rightarrow (x' (\text{fun } z \rightarrow x)))$     *substitute*

# Operational Semantics

- We write the “operational semantics” (i.e. the meaning of the language) in the following notation:

$$\text{exp} \Downarrow v$$

- Read this notation as “program **exp** evaluates to value **v**”

# Operational Semantics

$\text{exp} \Downarrow v$

- Specified using just two inference rules
- This is *call-by-value* semantics: function arguments are evaluated before substitution

Rule 1

$$\frac{}{v \Downarrow v}$$

“Values evaluate to themselves”

Rule 2

$$\frac{\text{exp}_1 \Downarrow (\text{fun } x \rightarrow \text{exp}_3) \quad \text{exp}_2 \Downarrow v \quad \text{exp}_3\{v/x\} \Downarrow w}{\text{exp}_1 \text{ exp}_2 \Downarrow w}$$

“To evaluate function application: Evaluate the function to a value, evaluate the argument to a value, and then substitute the argument for the function. ”
